

# Thermistors for temperature sensing

- Thermistors are sensitive resistors whose resistance changes with temperature, making them ideal for temperature sensing
- They come in two types: NTC (negative temperature coefficient), where resistance decreases as temperature increases, and PTC (positive temperature coefficient), where resistance increases with temperature
- Used in various applications, thermistors provide precise temperature readings in climate control, electronics, and automotive systems
- They offer quick response times and are cost-effective compared to other temperature sensors

## Practical example: Electronics

- Thermistors are a type of resistor whose resistance changes significantly with temperature, making them ideal for temperature sensing in electronics
- Commonly found in household devices like thermostats and refrigerators, they help regulate temperature by providing feedback to the control system
- Their quick responsiveness to temperature changes ensures the system operates efficiently and safely, maintaining the desired environmental conditions within electronic devices
