

Consider the point A to be in the position of the intersection between the incident ray and the surface of the cylinder.

Next, consider that point B is exactly where the incident ray reflects from the mirrored surface. The given point C, and the two described points form an triangle, with angle  $\theta_1$  which is the angle between radius line from the point C to the point A, and the incident ray path inside the cylinder. Also, the angle  $\theta_2$  is formed between radius line from the point C to the point B, and the incident ray path inside the cylinder.

By careful observation of the problem given figure, we can notice that the vertical component of the distance between A and B is  $\frac{d}{2}$ .

Therefore using the laws of trigonometry we can derive and evaluate the angle  $\alpha$ , which is a complementary angle to the angle  $\beta$ , that is the angle between lines CA and CB:

$$\begin{aligned}\sin \alpha &= \frac{\frac{d}{2}}{R} \\ \implies \alpha &= \arcsin \left( \frac{1}{2} \right) \\ \alpha &= 30^\circ\end{aligned}$$

Knowing this angle we can find the angle beta:

$$\begin{aligned}\beta &= 180^\circ - 30^\circ \\ &= 150^\circ\end{aligned}$$
