Analytical Modeling of Medium Access Control Protocols in Wireless Networks Marcelo Menezes Carvalho, 2006 A new modeling framework is introduced for the analytical study of medium access control MAC protocols operating in multihop wireless ad hoc networks i.e. wireless networks characterized by the lack of any pre existent infrastructure and where participating devices must cooperatively provide the basic functionalities that are common to any computer network The proposed modeling framework focuses on the interactions between the physical PHY and MAC layers and on the impact that each node has on the dynamics of every other node in the network To account for the effects of both cross layer interactions and the interference among all nodes a novel linear model is introduced with which topology and PHY MAC layer aspects are naturally incorporated in what we define as interference matrices A key feature of the model is that nodes can be modeled individually i.e. it allows a per node setup of many layer specific parameters Moreover no spatial probability distribution or special arrangement of nodes is assumed the model allows the computation of individual per node performance metrics for any given network topology and radio channel model **System Modeling and Analysis** Hisashi Kobayashi, Brian Lai-bue Mark, 2009 Kobayashi and Mark present the most up to date analytical models simulation techniques and computational algorithms useful for performance evaluation of complex systems including computer systems communication networks transportation systems and manufacturing systems Broader in scope than other texts this book provides more in depth coverage of topics such as computational algorithms and approximations It appeals to students with a background or interest in a wide range of areas including systems analysis or telecommunication networks Publisher s
