IRON MAKING AND STEELMAKING GHOSH, AHINDRA, CHATTERJEE, AMIT, 2008-02-29 This authoritative account covers the entire spectrum from iron ore to finished steel. It begins by tracing the history of iron and steel production right from the earlier days to today's world of oxygen steelmaking, electric steelmaking, secondary steelmaking and continuous casting. The physicochemical fundamental concepts of chemical equilibrium, activity, composition relationships and structure properties of molten metals are introduced before going into details of transport phenomena i.e. kinetics, mixing and mass transfer in ironmaking and steelmaking processes. Particular emphasis is laid on the understanding of the fundamental principles of the processes and their application to the optimisation of actual processes. Modern developments in blast furnaces including modelling and process control are discussed along with an introduction to the alternative methods of ironmaking. In the area of steelmaking, BOF plant practice including pre-treatment of hot metal, metallurgical features of oxygen steelmaking processes and their control form part of the book. It also covers basic open hearth, electric arc furnace and stainless steelmaking before discussing the area of casting of liquid steel, ingot casting, continuous casting and near net shape casting. The book concludes with a chapter on the status of the ironmaking and steelmaking in India. In line with the application of theoretical principles, several worked-out examples dealing with fundamental principles as applied to actual plant situations are presented. The book is primarily intended for undergraduate and postgraduate students of metallurgical engineering. It would also be immensely useful to researchers in the area of iron and steel. **Gasification for Practical**

Applications Yongseung Yun, 2012-10-24 Although there were many books and papers that deal with gasification, there has been only a few practical books explaining the technology in actual application and the market situation in reality. Gasification is a key technology in converting coal, biomass and wastes to useful, high-value products. Until renewable energy can provide affordable energy, hopefully by the year 2030, gasification can bridge the transition period by providing the clean liquid fuels, gas and chemicals from the low-grade feedstock. Gasification still needs many upgrades and technology breakthroughs. It remains in the niche market, not fully competitive in the major market of electricity generation, chemicals and liquid fuels that are supplied from relatively cheap fossil fuels. The book provides the practical information for researchers and graduate students who want to review the current situation to upgrade and to bring in a new idea to the conventional gasification technologies. Ironmaking and Steelmaking Processes Pasquale Cavaliere, 2016-09-02 This book describes improvements in the iron and steel making process in the past few decades. It also presents new and improved solutions to producing high quality products with low greenhouse emissions. In addition, it examines legislative regulations regarding greenhouse emissions all around the world and how to control these dangerous emissions in iron and steel making plants. *Treatise on*
