Abstract—The purpose of this study was to determine the effect of a 10-week training program on the physical fitness of 10-year-old children. The study was conducted in a primary school in the city of Ankara, Turkey. The study group consisted of 20 children (10 boys and 10 girls) who were randomly selected from the 10-year-old children in the school. The children were divided into two groups: a control group and an experimental group. The control group did not participate in any physical education program, while the experimental group participated in a 10-week training program. The physical fitness of the children was measured at the beginning and at the end of the 10-week period. The measurements included heart rate, blood pressure, and body mass index. The results of the study showed that the experimental group had significantly higher heart rates and blood pressures at the end of the 10-week period compared to the control group. The body mass index of the children in both groups did not change significantly. The results of this study suggest that a 10-week training program can improve the physical fitness of 10-year-old children.

The top two cleaning techniques are usually sufficient to maintain all safety properties provided the Tivvy is cleaned thoroughly.
