*Introduction to Functional Equations* Prasanna K. Sahoo, Palaniappan Kannappan, 2011-02-08 Introduction to Functional Equations grew out of a set of class notes from an introductory graduate level course at the University of Louisville. This introductory text communicates an elementary exposition of valued functional equations where the unknown functions take on real or complex values. In order to make the presentation as manageable as possible, [Handbook of Functional Equations](#) Themistocles M. Rassias, 2014-11-21 This handbook consists of seventeen chapters written by eminent scientists from the international mathematical community who present important research works in the field of mathematical analysis and related subjects particularly in the Ulam stability theory of functional equations. The book provides an insight into a large domain of research with emphasis to the discussion of several theories, methods and problems in approximation theory, analytic inequalities, functional analysis, computational algebra and applications. The notion of stability of functional equations has its origins with S. M. Ulam who posed the fundamental problem for approximate homomorphisms in 1940 and with D. H. Hyers and Th. M. Rassias who provided the first significant solutions for additive and linear mappings in 1941 and 1978, respectively. During the last decade the notion of stability of functional equations has evolved into a very active domain of mathematical research with several applications of interdisciplinary nature. The chapters of this handbook focus mainly on both old and recent developments on the equation of homomorphism for square symmetric groupoids, the linear and polynomial functional equations in a single variable, the Drygas functional equation on amenable semigroups, monomial functional equation, the Cauchy-Jensen type mappings, differential equations and differential operators, operational equations and inclusions, generalized module left higher derivations, selections of set valued mappings, D'Alembert's functional equation, characterizations of information measures, functional equations in restricted domains as well as generalized functional stability and fixed point theory. [Ulam Type Stability](#) Janusz Brzdek, Dorian Popa, Themistocles M. Rassias, 2019-10-29 This book is an outcome of two Conferences on Ulam Type Stability CUTS organized in 2016 July 4-9 Cluj Napoca Romania and in 2018 October 8-13 Timisoara Romania. It presents up to date insightful perspective and very resent research results on Ulam type stability of various classes of linear and nonlinear operators in particular on the stability of many functional equations in a single and several variables also in the lattice environments Orlicz spaces, quasi  $b$  Banach spaces and  $2$  Banach spaces and some orthogonality relations e.g. of Birkhoff James. A variety of approaches are presented but a particular emphasis is given to that of fixed points with some new fixed point results and their applications provided. Besides these several other topics are considered that are somehow related to the Ulam stability such as invariant means, geometry of Banach function modules, queueing systems, semi inner products and parapreseminorms, subdominant eigenvalue location of a bordered diagonal matrix and optimal forward contract design for inventory. New directions and several open problems regarding stability and non stability concepts are included. Ideal for use as a reference or in a seminar this book is aimed

toward graduate students scientists and engineers working in functional equations difference equations operator theory functional analysis approximation theory optimization theory and fixed point theory who wish to be introduced to a wide spectrum of relevant theories methods and applications leading to interdisciplinary research It advances the possibilities for future research through an extensive bibliography and a large spectrum of techniques methods and applications
